

staffITpro WEB - Technical Requirements

staffITpro WEB

staffITpro WEB is a 3 tier application that accesses database and documents by Internet using basic standards of common web applications. staffITpro WEB doesn't use browsers such as Internet Explorer, Firefox or Opera in order to access data. staffITpro WEB implements its own web browser that offers a highly flexible user interface that easily adapts to the user's needs. The staffITpro WEB Browser can be downloaded and installed within minutes from the staffITpro Website.

Worldwide Access to the staffITpro Web Server

In order to access the database, staffITpro WEB must be installed on a Windows based Web Server running IIS (Internet Information Server). A staffITpro Server component will be installed and integrated into the Web Server. This component accepts incoming requests and forwards them to the corresponding SQL Server database. The result of the request

will be returned to the staffITpro WEB Browser and instantly displayed. The Web Server access can be restricted to a local workgroup in your company or it can be opened up for Internet access using a public IP address. staffITpro WEB always guarantees high security standards using encrypted login procedures and encrypted data transfer using HTTPS.

The SQL Server database and the Web Server (IIS) can be located on the same computer. For higher security standards, the Web Server and the Database Server can be installed on two different computers.

Technical requirements for staffITpro WEB

Minimum requirements of the Server
